Report Overview

The active phased array radar (APAR) is a phased array radar whose transmitter and receiver functions consist of a number of small solid-state transmitting/receiving modules (TRM). In an active phased antenna array, each element or group of elements of the lattice has a micro-microwave transmitter with a passive phased array. In an active phased array, each element contains a module that contains a slot antenna, a phase shifter, a transmitter, and a receiver. By extending broadcasts across the spectrum, they can improve the performance of older passive electronically scanned radars, which make it difficult to detect background noise.
