Abstracts

An active stylus driver chip is a specialized integrated circuit designed to facilitate precise and responsive input for digital styluses used with touch-sensitive displays, such as those found in tablets, 2-in-1 laptops, and high-end smartphones. Unlike passive stylus technology, which relies on the capacitive properties of the screen, active stylus systems require a dedicated driver chip to manage power, signal transmission, and communication protocols (e.g., Bluetooth or proprietary interfaces) between the stylus and the device. This chip enables advanced features like pressure sensitivity, tilt recognition, palm rejection, and low latency, ensuring a natural writing or drawing experience. It typically integrates components for energy management (often including support for rechargeable batteries or supercapacitors), analog-to-digital conversion for sensor data, and firmware that handles real-time processing of input gestures. The performance of these chips is critical to the accuracy and functionality of digital pens, making them a key component in professional-grade creative tools, educational devices, and enterprise applications where precision input is required.

The global Active Stylus Driver Chip market size was estimated at USD 135.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
