## Abstracts

An active temperature controller is a device used to regulate and maintain precise temperatures in systems or equipment by continuously monitoring and adjusting temperature variables. Unlike passive temperature control, which might only provide basic cooling or heating, active controllers use sensors, feedback loops, and sometimes complex algorithms to actively modify the environment. They do this by adjusting elements such as heaters, coolers, fans, or thermoelectric modules to maintain the desired temperature within tight tolerances.

The global Active Temperature Controller market size was estimated at USD 1153.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
