Abstracts

Active wheel speed sensors are crucial electronic components in modern automotive systems, primarily used to monitor the rotational speed of each wheel in real time. They function by detecting teeth on a tone ring or magnetic encoder and converting this mechanical rotation into electrical signals, which are transmitted to the vehicle's anti-lock braking system (ABS), electronic stability control (ESC), traction control system (TCS), and other advanced driver-assistance systems (ADAS). These sensors ensure optimal braking performance, prevent wheel lock-up, maintain vehicle stability, and support features like adaptive cruise control and autonomous emergency braking. Typically employing either inductive (passive) or Hall-effect (active) technologies, active wheel speed sensors offer higher accuracy, better performance at low speeds, and greater reliability across varying conditions, making them increasingly standard in contemporary vehicles.

The global Active Wheel Speed Sensors market size was estimated at USD 3150.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
