Abstracts

Acute lung injury (ALI) and its more severe form, acute respiratory distress syndrome (ARDS), represent life-threatening conditions characterized by rapid-onset widespread inflammation in the lungs, leading to impaired gas exchange, severe hypoxemia, and often multi-organ failure; current treatment approaches are primarily supportive rather than curative, focusing on lung-protective mechanical ventilation, fluid management, prone positioning, and in some cases, pharmacological interventions such as corticosteroids or neuromuscular blocking agents, though no universally effective drug therapy has been established, leaving significant unmet medical needs and driving ongoing research into novel therapeutics targeting inflammatory pathways, endothelial and epithelial injury, and fibrosis.
