Report Overview:

Blind Spot Detection (BSD) system is a sensor based detection system implemented in automobiles that is used for monitoring vehicles at the rear and side of the driver/vehicle. Such systems generate tactile, audible, vibrating or visual form of warnings. They also assist the driver at the parking lots when there are other vehicles approaching from the sides. Blind spots are caused due to various objects such as passengers, headrests and window pillars. Mirrors are generally used to remove the blind spots but the disadvantage being that they leave huge dead on all the sides of the vehicle. BSD systems, with the help of cameras and sensor systems generate information about various objects that are outside the range of driver's vision.

Adaptive cruise control is similar to conventional cruise control in that it maintains the vehicle's pre-set speed. However, unlike conventional cruise control, this new system can automatically adjust speed in order to maintain a proper distance between vehicles in the same lane. This is achieved through a radar headway sensor, digital signal processor and longitudinal controller. If the lead vehicle slows down, or if another object is detected, the system sends a signal to the engine or braking system to decelerate. Then, when the road is clear, the system will re-accelerate the vehicle back to the set speed.

The Global Adaptive Cruise Control (ACC) and Blind Spot Detection (BSD) Market Size was estimated at USD 3941.26 million in 2023 and is projected to reach USD 4816.79 million by 2029, exhibiting a CAGR of 3.40% during the forecast period.
