Abstracts

ADAS hardware-in-the-loop testing refers to a method of real-time simulation testing of advanced driver assistance systems at the hardware level. In ADAS HiL testing, real ADAS hardware (such as sensors, control units, etc.) is integrated into a simulation environment to test and verify the vehicle's driving behavior through virtual scenarios. In this testing method, sensors (such as cameras, radars, lidars, etc.) receive inputs from the virtual environment through simulators, and the electronic control unit (ECU) makes decisions based on these inputs. The entire process enables developers to simulate real-world driving situations in the laboratory and test the system's response, decision-making, and performance under different driving conditions without the need for real vehicles to drive on the road. The advantage of ADAS HiL testing is that it can detect and correct system problems in the early stages of development, thereby saving development time and cost, while ensuring that the system can respond correctly in a wide range of scenarios, enhancing its reliability and safety.

The global ADAS Hardware-in-the-Loop (ADAS HiL) Test market size was estimated at USD 480.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
