## Abstracts

Addressable dedicated LEDs (light-emitting diodes) are semiconductor light sources designed for individual control of each diode within a display or lighting array, enabling precise manipulation of brightness, color, and on/off states independently from adjacent LEDs. Unlike non-addressable LEDs, which operate in unison across a circuit, these devices incorporate integrated circuits or controllers that allow them to respond to specific data signals, making them essential for applications requiring dynamic visuals, such as high-resolution video walls, large-format digital signage, architectural lighting, artistic installations, and advanced automotive lighting systems. This granular control supports complex animations, real-time content updates, and energy-efficient operation by illuminating only necessary elements, distinguishing them from simpler LED solutions that offer only uniform or grouped lighting effects.

The global Addressable Dedicated Led market size was estimated at USD 1200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
