## Abstracts

Addressable flame detectors are advanced fire detection devices used in industrial, commercial, and safety-critical applications. Unlike traditional detectors, which trigger an alarm based on general detection criteria, addressable flame detectors are connected to a network where each device has a unique identifier (address). This allows for precise location identification of the fire source, reducing response time and improving system efficiency. These detectors use various technologies, such as infrared, ultraviolet, or a combination of both, to detect the presence of flames based on their unique radiation signatures. Their ability to be integrated into a larger, more intelligent fire alarm system makes them ideal for environments where early and accurate fire detection is critical.

The global Addressable Flame Detectors market size was estimated at USD 591.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
