Abstracts

Adeno-associated virus (AAV) vector manufacturing refers to the process of producing recombinant AAV vectors that deliver therapeutic genes for gene therapy applications. This involves multiple stages including plasmid construction, transfection of producer cell lines (commonly HEK293), vector harvest, purification (via chromatography or ultracentrifugation), formulation, and rigorous quality control. AAV vectors are favored in clinical settings due to their low immunogenicity, long-term gene expression, and tissue tropism. Scalable, GMP-compliant manufacturing is essential to meet regulatory standards and ensure the safety, potency, and purity of gene therapy products.

The global Adeno Associated Virus Vector Manufacturing market size was estimated at USD 1650.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.20% during the forecast period.
