Abstracts

Adenylase cyclase inhibitors are a class of pharmacological agents that specifically target and inhibit the enzyme adenylate cyclase, thereby reducing the conversion of ATP to cyclic AMP (cAMP), a critical secondary messenger involved in numerous intracellular signaling pathways. These inhibitors are primarily utilized in research settings to study cAMP-mediated processes and are increasingly investigated for their therapeutic potential in conditions characterized by aberrant cAMP signaling, such as certain cancers, heart failure, and inflammatory disorders. Their mechanism involves direct or indirect interference with adenylate cyclase activity, often through G-protein coupled receptor modulation or allosteric binding, making them valuable tools for both basic science and drug development aimed at modulating cellular responses dependent on cAMP elevation.

The global Adenylase Cyclase Inhibitor market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
