Report Overview

The thermal conductive adhesive is mainly composed of the resin matrix, conductive particles, dispersion additives, additives and so on. The matrix mainly includes epoxy, acrylate resin, polychloride ester and so on. Although highly conjugated polymers have their own structures that conduct electricity, such as macromolecules such as pyridines, which can conduct electricity through electrons or ions, such conductive adhesives can only conduct electricity to the extent of semiconductors at most, can not have as low resistance as the metal, it is difficult to play the role of conductive connection. The conductive adhesive used in the market is mostly filler type.
