Abstracts

Adjustable focus liquid lenses represent a specialized category of optofluidic devices that utilize the electrowetting effect to manipulate the curvature of a liquid-liquid interface, thereby enabling rapid and precise focal length adjustments without mechanical moving parts. These lenses function by applying an electric field to alter the surface tension between two immiscible liquids?typically a conductive aqueous solution and an insulating oil?allowing for dynamic control over optical power with high speed, low power consumption, and minimal hysteresis. Key applications include microscopy, machine vision, barcode scanning, medical imaging, and smartphone cameras, where traditional solid lenses are limited by size, weight, response time, or mechanical complexity. The technology offers advantages in miniaturization, durability, and adaptability, making it suitable for integration into compact and automated optical systems that demand real-time focus tuning, vibration resistance, and silent operation.

The global Adjustable Focus Liquid Lens market size was estimated at USD 120.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
