Abstracts

Adrenoceptor blocking drugs, also referred to as adrenergic antagonists or alpha- and beta-blockers, are a class of pharmaceutical agents that inhibit the action of catecholamines such as adrenaline and noradrenaline by competitively binding to adrenergic receptors?specifically alpha-1, alpha-2, beta-1, and beta-2 subtypes?thereby modulating sympathetic nervous system activity. These drugs are widely utilized in the management of cardiovascular conditions, including hypertension, angina pectoris, arrhythmias, and heart failure, as well as non-cardiovascular applications such as benign prostatic hyperplasia, migraine prophylaxis, and glaucoma treatment. The market is characterized by a diverse range of molecules, both selective and non-selective, with varying receptor affinities that determine their therapeutic profiles and side effect patterns. Key examples include metoprolol (a beta-1 selective antagonist), propranolol (a non-selective beta-blocker), and doxazosin (an alpha-1 blocker), each addressing distinct clinical needs through mechanisms that reduce heart rate, blood pressure, cardiac output, or smooth muscle tone. The continued relevance of this drug class is supported by well-established efficacy, extensive clinical experience, and inclusion in numerous international treatment guidelines, though market dynamics are influenced by factors such as generic competition, emerging therapeutic alternatives, and evolving clinical evidence regarding long-term outcomes and patient subgroups.

The global Adrenoceptor Blocking Drugs market size was estimated at USD 4580.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
