Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Adsorption Chillers competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Adsorption Chillers is a refrigeration device driven by thermal energy, and its working principle is based on the adsorption and desorption characteristics of adsorbents to refrigerants. It mainly consists of an adsorber, a condenser, an evaporator, and a throttle valve. During the adsorption stage of the refrigeration cycle, the adsorbent at room temperature adsorbs the low - temperature and low - pressure refrigerant vapor from the evaporator, reducing the pressure inside the evaporator. This causes the liquid refrigerant to evaporate and absorb heat, achieving the refrigeration effect. In the desorption stage, thermal energy such as hot water, steam, or waste heat is input into the adsorber, which raises the temperature of the adsorbent and releases the adsorbed refrigerant vapor. The high - temperature and high - pressure refrigerant vapor then enters the condenser, where it releases heat and condenses into a liquid. The liquid refrigerant is then depressurized through the throttle valve and enters the evaporator to start a new refrigeration cycle. Adsorption refrigeration machines have many advantages. They can utilize low - grade thermal energy such as solar energy and industrial waste heat, with high energy utilization efficiency. Moreover, they operate silently without vibration, are environmentally friendly, and do not use ozone - depleting refrigerants. Therefore, adsorption refrigeration machines are widely used in some industrial settings with a large amount of waste heat available and in places with high requirements for environmental protection and quietness.

The global Adsorption Chillers market size was estimated at USD 209.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the
