Abstracts

The Adsorption Ultrasonic Therapy Apparatus is a medical device that uses ultrasonic waves to deliver therapeutic treatment to the body. The device works by emitting high-frequency sound waves that penetrate deep into the tissues of the body, causing them to vibrate. These vibrations create heat and friction in the tissues, which can help to increase blood flow, reduce inflammation, and promote healing. The device is typically used to treat conditions such as muscle spasms, joint pain, and inflammation. It is also commonly used in physical therapy settings to help patients recover from injuries or surgeries. The Adsorption Ultrasonic Therapy Apparatus consists of a handheld wand that emits the ultrasonic waves, along with a control unit that allows the user to adjust the intensity and frequency of the waves. The wand is placed directly on the affected area of the body and moved in a circular motion to deliver the treatment.

The global Adsorption Ultrasonic Therapy Apparatus market size was estimated at USD 280.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
