Abstracts

Advanced bipolar direct energy devices belong to a group of instruments in the electrosurgery sector that conduct high frequency alternating current through a patient's body to generate heat energy. The circuit is composed of an electrosurgical generator, an active electrode, a patient and a patient return electrode. Commonly, these instruments can be differentiated as monopolar or bipolar and can be used for cutting, coagulating, desiccating or fulgurating tissue. The use of bipolar electrosurgical devices to coagulate tissue prior to dissection is an effective and inexpensive method. Conventional devices such as staples and clips are commonly used for suture. Due to the high cost, repeated applications, and displacement problems associated with conventional devices, bipolar electrosurgical devices are preferred.

The global Advanced Bipolar Direct Energy Device market size was estimated at USD 893.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
