Abstracts

Advanced Driver Assistance Redundant Systems are safety-critical components integrated into modern vehicles to ensure the reliability and fail-safe operation of Advanced Driver Assistance Systems (ADAS). These systems incorporate additional layers of backup functionality, ensuring that even in the event of a failure in a primary system, the vehicle's safety and core functions remain operational. As the level of assisted driving becomes higher and higher, the driving subject gradually changes from the driver to the vehicle system. In order to ensure that it is always in operation, a redundant system is essential. For self-driving cars, safety is the primary prerequisite. Only by achieving redundancy like in the aviation field can advanced autonomous driving ensure real safety. At present, the redundancy range of advanced assisted driving mainly includes perception and positioning redundancy (environmental monitoring), controller redundancy (brain), actuator redundancy (braking, steering), communication redundancy (control information transmission), and power supply redundancy (support failure degradation).

The global Advanced Driver Assistance Redundant Systems market size was estimated at USD 2494.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.20% during the forecast period.
