Report Overview

Advanced renal cell carcinoma is associated with a type of kidney cancer that appears in the covering of the proximal complex tubule. The convoluted tubule is a very small part of tubes in the kidney that helps in transportation of unwanted particles from the blood to the urine. Advanced renal cell carcinoma is the most common type of kidney cancer in adults that represents nearly 2-3% of all cancer cases in adults. The disorder is asymptomatic in advanced renal cell carcinoma at initial stages that results with people often in the advanced stages of the disease by the time it is discovered. The initial symptoms of renal cell carcinoma are a general feeling of being unwell, hypertension, flank pain, weight loss, fever, blood in the urine, night sweats, and a mass in the abdomen. Management of renal cell carcinoma has seen significant development in the past few years, and new approaches are being established. Advanced renal cell carcinoma is a disease that normally cannot be treated by general therapy and is challenging to treat. Surgical removal of one or both kidneys should be considered in patients who suffer from metastatic disease before systemic therapy.
