Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Aeolian Vibration Spiral Damper competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the estimated global shipment volume of aeolian vibration spiral dampers was approximately 1.77 million units, with an average price of approximately USD 62 per unit and a typical gross profit margin of approximately 20%-30%. A aeolian vibration spiral damper (also known as a spiral damper) is a device that uses a helical metal or composite structure to convert wind-induced (wind-induced vibration) or mechanical vibration energy into heat or strain energy, thereby reducing fatigue damage to structures such as cables, conductors, and towers under wind or vibration loads. Its common parameters include: helical coil diameter (e.g., 8-20 mm), wire diameter, material (galvanized steel, stainless steel, aluminum alloy, composite materials, etc.), damping constant, recommended installation span, weight (tens to hundreds of grams per unit), and UV resistance and weather resistance selection (for overhead power/communication line applications). A typical product is the steel helical (OPGW) vibration damper, a common model used in optical fiber steel core (OPGW) applications. Upstream, these vibration dampers primarily rely on high-strength steel wire (or composite wire), spiral forming equipment, anti-corrosion coatings (galvanized, stainless, or polymer coatings), plastic or composite protective sleeves, and packaging and testing equipment; downstream, they are supplied by power transmission companies, telecommunications operators, wind turbine tower manufacturers, and infrastructure builders. Telenco holds a significant share among the world's leading vibration damper manufacturers, with stable shipments for many years and a considerable production capacity. The future development of the aeolian vibration spiral damper market is characterized by stable growth and technological upgrades. On

the one hand, with the continuous expansion of global power infrastructure (especially new energy wind power lines and suburban transmission networks) and communication infrastructure (5G/6G, fiber optic backbone networks), the requirements for line wind vibration and mechanical vibration management are becoming more stringent, driving the demand for high-performance vibration dampers. On the other hand, materials and manufacturing processes are constantly evolving, with manufacturers adopting more weather-resistant stainless steel or composite materials, UV-resistant coatings, and even intelligent monitoring (integrated sensors to monitor vibration fatigue in real time) technologies to improve the lifespan, efficiency, and installation reliability of vibration dampers. In addition, adjustable designs (adjustable pitch and number of turns) and customized vibration dampers (for specific spans or climatic conditions) are also increasing.

The global Aeolian Vibration Spiral Damper market size was estimated at USD 109.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
