Report Overview:

The aeroderivative gas turbine is a lighter weight variation of a gas turbine. Despite being classified as a gas turbine, the fuel source for the aeroderivative turbine is not really gas. Actually, they are designed so that fuel and air are mixed and then ignited to achieve the desired output. The design of gas turbines is comprised of a compression device to facilitate the taking in of air and compressing it (the “gas” in this case) and then applying heat by means of a burner. The resulting flow of hot air is used as the source of powering the turbine. Today, these are typically designed to make use of a combustion process that is continuous as opposed to the intermittent nature of automotive combustion engines.

The Global Aeroderivative Gas Turbine Market Size was estimated at USD 1329.42 million in 2023 and is projected to reach USD 1462.26 million by 2029, exhibiting a CAGR of 1.60% during the forecast period.
