Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Agarose Chromatography Microspheres competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of agarose chromatography microspheres will reach 143 kg, with an average selling price of US\$722/g. Agarose chromatography microspheres are spherical microparticles prepared using agarose (a linear polysaccharide extracted from seaweed) as a matrix via an emulsification-solidification method or a reverse microemulsion method. Preparation typically involves dispersing an agarose solution in an organic phase (such as liquid paraffin). The microspheres are then stirred, emulsified, and cooled to solidify. The microspheres are then chemically cross-linked using a cross-linking agent (such as epichlorohydrin) to enhance mechanical strength. The cross-linked microspheres have a three-dimensional network structure. The pore size can be controlled by the agarose concentration and the degree of cross-linking. The pore size typically ranges from 20 to 350 μm , making them suitable for separating substances of varying molecular weights.

The global Agarose Chromatography Microspheres market size was estimated at USD 103.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
