Abstracts

The agate grinder is a machine designed to meet the grinding needs of hard materials such as agate. It processes the particle size, shape, surface finish and other aspects of hard materials such as agate through specific grinding movements to achieve the desired grinding effect. The working principle of the agate grinder is mainly based on the grinding movement between the agate mortar and the pestle. The bottom surface of the mortar is a hemispherical surface, which is hard, wear-resistant, and very smooth. It is driven by a slow-speed reduction motor to rotate. The head of the pestle is also a hemispherical surface, and the center line of the pestle intersects with the center line of the mortar at a suitable oblique angle. The pestle extends into the mortar and fits tightly with the bottom of the mortar under the action of the spring. The pestle is driven by a fast-speed reduction motor to rotate similar to the conical trajectory of a cone. This mode of movement allows solid particles to be evenly ground between the mortar and the pestle to achieve the desired particle size.

The global Agate Grinding Machine market size was estimated at USD 480.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
