Report Overview:

Agates are semi-precious gemstones that are a variegated form of chalcedony, which is silicon dioxide in the form of microscopic fibrous quartz crystals.

Agates naturally develop when an empty pocket inside a host rock fills in molecule-by-molecule, layer-by-layer as these microcrystals self-organize to form concentric bands or other patterns. The colors and arrangement of the microcrystals are influenced by changes in pressure, temperature, and mineral content that occur during the formation process.

Unlike other gemstones, each agate is unique. Even slabs cut from the same specimen will vary in color and design.

The Global Agate Market Size was estimated at USD 342.95 million in 2023 and is projected to reach USD 322.88 million by 2029, exhibiting a CAGR of -1.00% during the forecast period.
