Abstracts

Aged Care Software refers to a digital management and service system specifically designed for elderly care institutions, community elderly care service centers, home-based elderly care scenarios, and related regulatory agencies. By integrating core functions such as health monitoring, care management, service scheduling, administrative operations, and family interaction, it achieves standardization, intelligence, and efficiency throughout the entire elderly care service process. Its core objectives are to improve the quality of elderly care, ensure the safety of the elderly, optimize the operational efficiency of institutions, and at the same time, create a closed loop for elderly care services from "institutions to communities to homes". The integration of technologies such as artificial intelligence, the Internet of Things, and big data with elderly care software is becoming increasingly profound. On the one hand, the software combines wearable devices, smart mattresses, and other hardware to collect real-time data on the elderly's heart rate, blood pressure, and activity trajectory. AI algorithms then analyze this data to provide health risk warnings, such as predicting acute exacerbations of chronic diseases and fall risks, and automatically push reminders to medical staff and family members. On the other hand, the health profiles of the elderly built based on big data are becoming increasingly comprehensive. The software can then generate customized service plans, such as creating personalized diet and medication plans for diabetic elderly and planning individualized rehabilitation training processes for post-operative elderly, shifting nursing services from "standardization" to "precision." The software is no longer limited to a single elderly care scenario but extends to and collaborates across all scenarios?institutional, community, and home-based elderly care. On the institutional side, the software will further integrate functions such as bed management, nursing scheduling, and material procurement to improve the operational efficiency of nursing homes and care facilities. On the community side, it will connect to modules such as activity booking, day care

registration, and volunteer dispatch from community elderly care service centers, making it convenient for seniors to access services nearby. On the home side, in addition to basic health monitoring, it will add functions such as ordering housekeeping services, online shopping, and booking in-home care. At the same time, data between different scenarios will be interconnected. For example, physical examination data taken by seniors in the community can be synchronized to the home care software, and rehabilitation suggestions from institutions can be pushed to the community service system in real time, forming a seamless nursing closed loop.

The global Aged Care Software market size was estimated at USD 416.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
