Abstracts

Agitation blades are the most important component of an agitator because they are responsible for transmitting the rotational energy from the motor into the tank. The rotational energy is mainly used for the discharge action, which creates a circulating flow throughout the tank, and the shearing action, which applies a local shearing force. The shape of the agitation blade can be optimized depending on whether the discharge or shearing action is desired first. The agitation blade that best suits the purpose can be selected by determining the maximum capacity that can be achieved within the fixed power of the motor. Typical agitation blades include propeller blades, turbine blades, anchor blades, paddle blades, and ribbon blades.

The global Agitation Blade market size was estimated at USD 1590.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
