Abstracts

Glufosinate, also known as L-glufosinate-ammonium, was first discovered in soil Streptomyces fermentation product bialaphos. It is metabolized into L-glufosinate-ammonium and two amino acids in plants. It is a natural amino acid herbicide with a C-P-C structure. Its green, safe and environmentally friendly significance is significantly superior to chemical synthetic herbicides such as diquat, glyphosate and ordinary glufosinate-ammonium. Glufosinate-ammonium belongs to the phosphonic acid herbicide, and its mechanism of action is the same as that of glufosinate-ammonium. Glufosinate-ammonium is a racemate of D/L-glufosinate-ammonium, and only L-glufosinate-ammonium has herbicidal activity. It acts on plant glutamine synthetase to inhibit L-glutamine synthesis, resulting in accumulation of cytotoxic ammonium ions, ammonium metabolism disorders, amino acid deficiency, chlorophyll disintegration, and photosynthesis inhibition, ultimately killing weeds completely.

The global Agricultural Glufosinate market size was estimated at USD 1283.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.50% during the forecast period.
