Report Overview

Agricultural fumigants play a significant role in agriculture, turf grass and nursery which makes soil fumigation a beneficial process for farmers as well as food consumers.

Fumigation is a pest control technique in which the land is filled with gaseous fumigants to free the land from disinfectants. Soil fumigants are implemented before crop plantation to eradicate the pests present in the soil.

Soil fumigants fight against soil-borne pests, including nematodes, fungi, bacteria, weeds, and insects. Particularly used for potato, tomato, carrot, and strawberry, and among various other fruits and vegetables. When applied to the soil, it instantly gets converted into gas and forms a protection layer around the root; this in turn protects the crop from harmful pathogens present in the soil.

On the basis of geography, the global agricultural fumigant market place is segmented into North America, Europe, Asia-Pacific, Middle-East and Africa. APAC regions are expected to witness a larger market share owing to rising economic growth and food demands. Rising population in China is another factor that boosts the soil fumigant market in this region. North America is expected to be the second largest player on global level. Middle-East and other regions are potential markets owing to rapid economic and industrial growth in the past decade.
