Report Overview

Agricultural micronutrients are elements that control certain activities in crops to increase the yield and improve their quality. These agricultural micronutrients help in protecting crops from insects and infections, ensuring the proper growth of crops and good health of supply chain and consumers.

As the deficiency of micronutrients can lead to various diseases in plants that may reduce quality and quantity of plants. Increasing preference for Genetically Modified (GM) seeds across the globe is also likely to impact the growth of the global market for agriculture micronutrients. Increasing use of chemical fertilizer is also driving the growth of micronutrients, as it protects crops from insects, UV radiations, and also offer increased yield. The demand for zinc is growing across various regions especially in the Asia Pacific. Owing to the deficiency of zinc in soil, the productivity of agricultural crop is decreasing. Hence, increasing number of companies are focusing on providing zinc as micronutrient for agricultural crops. However, factors such as extensive irrigation facilities, mining of micronutrient reserves and increasing use of high chemical fertilizers are resulting in the global shortage of micronutrients.
