Report Overview

AGV (Automated Guided Vehicle) and AMR (Autonomous Mobile Robot) refer to types of mobile robots used in industrial settings for material handling and logistics. AGVs are guided by predefined paths or markers on the floor, following a fixed route for transportation tasks. They often require physical modifications to the environment for guidance. In contrast, AMRs utilize advanced sensors, cameras, and mapping technologies to navigate autonomously without the need for predefined paths. AMRs can adapt to dynamic environments, avoiding obstacles and optimizing routes on the fly. Both AGVs and AMRs play crucial roles in improving efficiency and automation in warehouses, manufacturing facilities, and distribution centers, contributing to the advancement of autonomous logistics and smart factories.
