Abstracts

AI Agent Platforms are rapidly becoming the “operating layer” for enterprise autonomy: they sit between foundation models and business systems, providing planning/execution loops, tool calling, memory/state, and governance so agents can complete multi-step work rather than just chat. The vendor landscape is bifurcating into two mutually reinforcing stacks. On the cloud/runtime side, OpenAI has positioned the Responses API and agent SDKs as a native agent primitive; AWS is scaling Bedrock Agents with multi-agent collaboration, memory, and Guardrails plus an enterprise operations layer; Microsoft is pushing Azure AI Foundry Agent Service and the Microsoft Agent Framework alongside Copilot Studio for low-code agent creation; Google is standardizing Vertex AI Agent Builder with the open-source ADK and Agent Engine for production runtimes; and Anthropic is differentiating with strong tool-use and “computer-use” capabilities that let agents operate real UIs. On the enterprise SaaS/data side, AI Agent Platforms are being embedded directly into workflow and data planes/Salesforce Agentforce (with Atlas reasoning and centralized command-center observability) and ServiceNow AI Agents/Orchestrator are turning CRM and ITSM into agent-native surfaces, while Databricks’ Mosaic AI Agent Framework pulls agent building, evaluation, and deployment into the lakehouse. Across these stacks, core parameters buyers now benchmark for AI Agent Platforms include: (i) model-agnosticity and routing across multiple FMs, (ii) depth of tool/connector ecosystems for APIs, RPA, and RAG retrieval, (iii) stateful memory and graph-based multi-agent orchestration for long tasks, (iv) observability/evaluation (tracing, win-rate, cost-per-task, regression tests), (v) enterprise identity, policy, and data-residency guardrails, and (vi) reliability controls such as human-in-the-loop approvals and sandboxing. Application gravity is shifting from pilots to repeatable digital labor in customer service, sales ops, IT/HR service management, software engineering copilots, and document-heavy compliance workflows, supported by a supply chain that runs upstream from frontier models and

cloud/GPU capacity, through midstream orchestration + vector databases + security/monitoring, to downstream vertical solution packs and integrators. Recent industry moves underline the consolidation race inside AI Agent Platforms; a concrete example is Salesforce's acquisition of Convergence.ai (signed in May 2025 and completed in June), bringing adaptive UI-navigating agents directly into Agentforce to accelerate 'do-work' autonomy in real enterprise software. Multi-agent, governed, and workflow-embedded autonomy is the clear direction of travel for AI Agent Platforms. The market is moving from single-bot task scripts to **graph-structured multi-agent systems** with explicit state, retries, and delegation, which raises the value of orchestration frameworks and runtimes. Standardized 'agent-to-agent / tool' protocols are emerging to reduce integration friction across clouds and SaaS, while observability and automated evaluation are becoming mandatory to close the trust gap at scale. Technically, hybrid reasoning (LLM planning plus deterministic guardrails), retrieval-grounded actions, and secure tool execution are converging as default platform capabilities; commercially, usage-based 'pay-per-task/credit' pricing and agent marketplaces are spreading, enabling enterprises to start small but scale quickly once ROI is proven. The biggest growth pockets sit in regulated and process-dense domains—finance, healthcare, government services, and large-scale back-office operations—where AI Agent Platforms can replace brittle RPA with adaptive agents that survive UI drift, policy changes, and long-tail exceptions, while also creating a new layer of 'agent operations' roles inside enterprises.

The global AI Agent Platforms market size was estimated at USD 524.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.00% during the forecast period.
