Abstracts

According to the latest global cancer burden data for 2020 released by the World Health Organization's International Agency for Research on Cancer (IARC), the number of new breast cancer cases worldwide reached 2.26 million, exceeding the 2.2 million cases of lung cancer. Breast cancer replaced lung cancer and became the world's largest cancer. In the absence of a good strategy for early prevention, early screening, early detection, and early treatment are particularly important. In the early screening stage, artificial intelligence participates in breast imaging interpretation, covering a large number of people and making screening more accurate and efficient. Breast cancer screening based on AI technology is a method of analyzing and interpreting breast images using artificial intelligence algorithms. It can quickly process a large amount of image data and identify potential lesion characteristics, thereby achieving high-precision early diagnosis; this screening technology significantly improves the efficiency and quality of diagnosis with its high efficiency and accuracy, and provides doctors with reliable auxiliary decision support; the application of this technology gives AI technology important significance in the medical field and promotes the development of medical diagnosis towards intelligence and precision.
