Abstracts

AI Building Generator is an intelligent design tool based on artificial intelligence (such as generative large models, parametric algorithms, and Building Information Modeling (BIM)). It can automatically generate compliant and constructible building schemes based on user-input text instructions, site conditions, regulatory constraints, or hand-drawn sketches. These schemes include floor plans, facade designs, 3D models, and performance simulations such as energy consumption and sunlight exposure, significantly improving early-stage design efficiency and creative exploration capabilities. Its upstream industry chain includes AI large model platforms, BIM/CAD software vendors, Geographic Information System (GIS) service providers, and cloud computing infrastructure providers. The midstream consists of technology companies specializing in AIGC architectural design, requiring the integration of architectural knowledge graphs, generative algorithms, human-computer interaction, and engineering implementation capabilities. The downstream primarily targets architectural design institutes, real estate developers, urban planning departments, and independent architects, delivering solutions through SaaS subscriptions, API calls, or customized projects. Since core costs are concentrated in early-stage algorithm development and marginal delivery costs are low, the industry's overall gross profit margin is generally between 60% and 85%. Standardized SaaS products can achieve a gross profit margin of over 80%, while customized solutions have a slightly lower gross profit margin (around 50% to 70%), but a higher average order value and stronger customer loyalty.

The global AI Building Generator market size was estimated at USD 821.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
