Abstracts

An AI Deepfake Detector is a technological tool designed to identify, detect, and mitigate the presence of Deepfake content. Deepfakes refer to highly realistic and often indistinguishable from genuine content created using advanced artificial intelligence techniques, particularly those involving generative adversarial networks (GANs) and other deep learning models. These models can synthesize images, audio, or videos that mimic the appearance and voice of real individuals, often to the point where they are difficult to discern from authentic material through visual or auditory inspection alone. The AI Deepfake Detector utilizes various AI algorithms, image analysis techniques, and multimodal data analysis methods to automatically detect and recognize Deepfake content. It operates by identifying subtle artifacts or inconsistencies within the image or audio that are indicative of tampering, such as minor facial distortions, abnormal voice frequencies, or discrepancies in lip synchronization.

The global AI Deepfake Detector market size was estimated at USD 186.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 38.00% during the forecast period.
