Abstracts

AI Frame Interpolation is an intelligent video enhancement tool based on deep neural network and optical flow prediction technology. It is dedicated to intelligently generate transition frames between existing video frames to achieve functions such as video smoothness improvement, slow motion generation or frame rate conversion. Its core technologies include temporal consistency modeling, scene motion estimation and content generation network, which can accurately identify the position and motion trend of objects in the previous and next frames, and predict the pixel information of the intermediate frames. AI frame interpolation is widely used in film and television post-production, motion slow motion processing, old low frame rate video repair, game frame filling, virtual reality rendering optimization and other scenes. Compared with traditional linear interpolation or optical flow method, AI interpolation can effectively avoid screen tearing, ghosting or blurring, especially in dynamic and complex backgrounds, it has higher structural retention and image clarity.

The global AI Frame Interpolation market size was estimated at USD 1504.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.10% during the forecast period.
