Abstracts

AI-Powered Ergonomics Assessment Software is an advanced tool that integrates artificial intelligence (AI) technologies—such as computer vision, machine learning algorithms, and deep learning models—with ergonomic principles, anthropometric data, and biomechanical analysis to automate and enhance the evaluation of human-machine interactions. It leverages AI to dynamically capture, process, and interpret real-time or pre-recorded data, including human posture, movement trajectories, muscle activity (via sensors or video), physiological metrics (e.g., heart rate variability), and environmental factors (e.g., workstation layout), enabling it to identify high-risk ergonomic issues (e.g., repetitive strain, awkward postures, excessive force) with greater precision than traditional software. Unlike static assessment tools, its AI capabilities allow for adaptive learning: as it processes more data, it refines its risk-prediction models to recognize nuanced patterns (e.g., subtle posture shifts in long-duration tasks) and deliver personalized, context-aware recommendations—such as adjusting workstation height, modifying task sequences, or suggesting movement breaks—to minimize musculoskeletal disorder (MSD) risks, optimize worker comfort, and improve operational efficiency. Widely applied in manufacturing, healthcare, office ergonomics, and remote work settings, this software transforms raw data into actionable insights, bridging the gap between manual ergonomic audits and proactive, data-driven workplace safety and well-being strategies.

The global AI-Powered Ergonomics Assessment Software market size was estimated at USD 264.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
