Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on AI Toy Chip competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. AI toy chips are a type of integrated circuit chips specifically used in smart toy products. They integrate multiple functions such as artificial intelligence (AI) computing power, speech recognition and synthesis, image processing, sensor interface, edge reasoning and communication modules, and are the core hardware for realizing the intelligence, interaction and personalization of toys. Compared with traditional toy chips, AI toy chips have higher computing performance and perception capabilities, and can support intelligent functions such as voice wake-up, semantic understanding, image recognition, motion control, and learning feedback. Such chips usually have the characteristics of low power consumption, small package, and real-time response. They support local offline processing or cloud collaboration. Some of them also integrate TinyML inference engines, which can run lightweight neural network models and realize edge AI computing. At the same time, AI toy chips also emphasize data security and children's safety. More and more products meet environmental protection and children's electronic toy certification standards such as RoHS and REACH. With the popularization of AI technology and the increasing demand of parents for "edutainment", AI toy chips have become one of the key driving forces for the upgrading of the children's smart toy industry.

The global AI Toy Chip market size was estimated at USD 246.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.30% during the forecast period.
