Abstracts

AI video frame interpolation tools are a type of video processing software based on deep learning algorithms. They intelligently generate transition frames between existing video frames, thereby increasing the original video's frame rate to higher levels (for example, from 30fps to 60fps, 120fps, or even 240fps), achieving smoother playback and more consistent motion. These tools typically utilize neural network models such as temporal convolution, optical flow estimation, or the Transformer, combined with inter-frame motion vector prediction and context-adaptive compensation mechanisms to accurately construct intermediate frames. They are widely used in film and television post-production, slow-motion generation, low-frame animation re-framing, content optimization for short video platforms, VR/AR image smoothing, and game CG enhancement.

The global AI Video Frame Interpolation Tool market size was estimated at USD 1521.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.30% during the forecast period.
