Report Overview

An air-breathing ducted jet engine is a jet engine that emits a jet of hot exhaust gases formed from air that is forced into the engine by several stages of centrifugal, axial or ram compression, which is then heated and expanded through a nozzle. They are typically gas turbine engines. The majority of the mass flow through a ducted jet engine is provided by air taken from outside of the engine and heated internally, using energy stored in the form of fuel.

The global Air-Breathing Ducted Jet Engines market size was estimated at USD 41620 million in 2023 and is projected to reach USD 70915.40 million by 2032, exhibiting a CAGR of 6.10% during the forecast period.
