Abstracts

The air cell cushion is a new type of cushion with multiple small airbags inside. When a person sits on the air cell cushion, the air cells will adapt according to the weight and pressure distribution of the human body. The air cells can provide good support for the body, especially for the key parts of the waist and hips. When squeezed by external force, the gas in the air cells can flow to each other, thereby dispersing the pressure and avoiding excessive local pressure. There are usually gaps between the air cells, which helps air circulation and improves the breathability of the cushion. Compared with traditional solid cushions, air cell cushions can reduce the feeling of stuffiness and humidity, allowing users to stay dry and comfortable even when sitting for a long time, especially suitable for use in hot summer.

The global Air Cell Cushions market size was estimated at USD 99.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
