Abstracts

An air conditioning capacitor is an essential electrical component within HVAC systems that stores and releases electrical energy to start and run the compressor, fan motor, and other critical parts of the unit; it functions by creating a phase shift in the motor's current, providing the necessary torque for startup and maintaining consistent operation, and is categorized primarily into start capacitors, which deliver a high burst of energy for initial motor activation, and run capacitors, which provide continuous energy to keep the motor running efficiently. These components are critical for system performance, energy efficiency, and reliability, and are subject to wear and eventual failure due to factors such as heat exposure, electrical stress, and age, making them a common replacement part in both residential and commercial HVAC maintenance and repair.

The global Air Conditioning Capacitor market size was estimated at USD 1075.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
