Abstracts

An air cooled central chiller is a self-contained refrigeration system designed for large-scale cooling applications, such as commercial buildings, industrial facilities, or data centers, which utilizes ambient air to dissipate heat from the refrigerant instead of relying on a separate water source or cooling tower. These systems consist of key components including a compressor, condenser, expansion valve, and evaporator, with the condenser coils being directly exposed to the outside air, allowing heat exchange to occur through forced convection facilitated by fans. By eliminating the need for water consumption or complex piping associated with cooling towers, air cooled chillers offer advantages in terms of simplified installation, reduced water usage, and lower maintenance requirements, though they generally exhibit lower energy efficiency compared to water cooled alternatives, particularly in high ambient temperature conditions. This type of chiller is particularly favored in regions with water scarcity, space constraints, or where operational simplicity and lower initial infrastructure costs are prioritized.
