Abstracts

Air cooled fiber lasers are a type of solid-state laser system that utilizes optical fibers doped with rare-earth elements as the gain medium and relies on passive or forced-air convection for thermal management, eliminating the need for complex external chillers or water-cooling infrastructure. These lasers are characterized by their compact design, energy efficiency, and operational simplicity, making them particularly suitable for applications where space constraints, portability, or reduced maintenance are prioritized, such as in light industrial marking, engraving, cutting, and educational or research environments. By forgoing liquid cooling systems, they offer lower operational costs, reduced risk of coolant leaks, and easier integration into smaller workspaces, though they generally feature lower maximum power outputs compared to their water-cooled counterparts, positioning them as ideal solutions for low-to-mid power laser processing tasks.

The global Air Cooled Fiber Laser market size was estimated at USD 2022.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
