Abstracts

An air cooled flake ice machine is a refrigeration system designed to produce flake ice by spraying water onto an evaporator surface, where it freezes and is scraped off into thin, irregularly shaped flakes; these machines utilize ambient air for heat exchange through a condenser, eliminating the need for a continuous water supply for cooling, making them particularly suitable for applications where water conservation is important or where a separate water cooling system is impractical. The resulting ice has a high surface area-to-volume ratio, providing excellent cooling efficiency and moldability, which is ideal for industries such as food processing, healthcare, fisheries, concrete cooling, and retail displays where rapid and consistent cooling with minimal water content is required.

The global Air Cooled Flake Ice Machine market size was estimated at USD 125.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
