Abstracts

An air-cooled liquid cooler is a heat exchange device that combines the principles of liquid cooling and forced air convection to manage thermal output from high-performance components, primarily CPUs and GPUs in desktop computing systems. It consists of a water block that mounts directly onto the processor, a pump that circulates a coolant (typically a glycol-water mixture) through sealed tubes, a radiator with integrated fins to dissipate heat, and one or more fans that push ambient air across the radiator surface. This hybrid design leverages the high thermal conductivity of liquid to efficiently transfer heat away from the source and the scalability of air cooling to expel it into the environment, offering a balance between the superior cooling performance of custom water loops and the simplicity and reliability of traditional air coolers. Unlike all-in-one (AIO) liquid coolers that may use larger radiators or multiple fan configurations, air-cooled liquid coolers are characterized by their self-contained, maintenance-free operation and are specifically engineered to fit within standard PC cases without the complexity of custom plumbing, making them particularly appealing to gaming enthusiasts, overclockers, and users seeking quieter and more efficient thermal management than standard air heatsinks can provide.

The global Air Cooled Liquid Cooler market size was estimated at USD 1120.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.45% during the forecast period.
