Report Overview

The air-cooled refrigerator is a type of refrigeration system that uses air as the heat transfer medium for cooling. It typically consists of a compressor, condenser, evaporator, and expansion valve. The compressor pumps refrigerant gas to the condenser where it is cooled by ambient air. The cooled refrigerant flows to the evaporator where it absorbs heat from the surrounding environment, cooling the contents inside the refrigerator. The heated refrigerant then returns to the compressor to complete the refrigeration cycle. Air-cooled refrigerators are commonly used in domestic and commercial applications due to their simplicity, cost-effectiveness, and ease of installation.
