Abstracts

An air core smoothing reactor is an inductive component used in power electronics and electrical systems, particularly in high-voltage direct current (HVDC) transmission, renewable energy integration, and industrial drive applications, to limit and filter current ripples, suppress harmonic distortions, and enhance system stability by providing impedance without the use of a magnetic core, thereby avoiding saturation issues and reducing losses; its design typically involves concentric coils arranged in a non-magnetic structure, often using aluminum or copper conductors, and it is valued for its linear inductance characteristics, high reliability, and ability to handle large currents and voltages with minimal maintenance requirements.

The global Air Core Smoothing Reactor market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
