Abstracts

An air driven diaphragm pump, also known as an AODD (Air Operated Double Diaphragm) pump, is a type of positive displacement pump that utilizes compressed air as its power source to transfer fluids through the reciprocating action of two flexible diaphragms. These diaphragms are connected by a common shaft and operate in alternating cycles, where one diaphragm discharges fluid while the other draws it in, creating a smooth, pulseless flow that can handle a wide range of viscosities, solids, abrasives, and shear-sensitive materials without damage. The pump's design ensures it is self-priming, can run dry without harm, offers variable flow rates through air pressure adjustment, and provides explosion-proof operation, making it highly versatile and suitable for challenging environments such as chemical processing, wastewater treatment, mining, food and beverage production, and pharmaceutical applications where safety, reliability, and handling of diverse media are critical.

The global Air Driven Diaphragm Pump market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
