## Abstracts

Air energy heat pump water heater is an energy-efficient hot water solution. It uses the reverse Carnot cycle principle to extract low-grade heat energy from the air and convert it into high-grade heat energy for heating water. This device works through a refrigerant circulation system consisting of components such as a compressor, evaporator, condenser and expansion valve. When the outside air passes through the evaporator, the low-temperature and low-pressure refrigerant absorbs the heat in the air and evaporates, and is then compressed by the compressor into a high-temperature and high-pressure state, releasing heat in the condenser to the water in the water tank, completing the heating process.

The global Air Energy Heat Pump Water Heaters market size was estimated at USD 3858.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
