Report Overview

Air Lock-up Valve is a device that uses main air supply as signal pressure. When supply pressure of air supply is lower than set pressure, it detects the pressure in time and can automatically cut off the gas circuit. When compressed air supply fails and air supply is stopped, control channel of the valve is cut off by using pneumatic lock up valve to keep the valve position before the air is cut off to ensure normal operation of the process.

After the accident in the system is eliminated and the air is supplied again, pneumatic lock up valve does not open the channel until the control is restored to normal.
